TITLE: On the two-dimensional movement of an ionized liquid in a layer of finite thickness, which is normal for a constant magnetic field

CITED SOURCE: Dokl. VI Nauchn. konferentsii Novokuznetskogo ped. in-ta po fiz.-matem. naukam. Novokuznetsk, 1963, 105-108

TOPIC TAGS: magnetism, ionized liquid magnetism, magnetic field

TRANSLATION: The author searches in a linearized arrangement for small disturbances of a homogeneous magnetic field, in a band of constant width of a nonviscous, noncompressible, infinitely conductive liquid, when the given field is directed perpendicular to the band. It is assumed in this case that the disturbances of the magnetic field, the speed, the electrical field, and the current lie on the plane of the band, and the pressure gradient can be omitted. The disturbed magnetic field is given in the form of the product of two functions: one depends upon the coordinates lying on the plane of the band, and the other on time and the coordinate perpendicular

Card 1/2

ACCESSION NR: AR4034723

to the plane of the band, in which case, only the last function is found (in the form of Fourier series with a constant coefficient). To calculate emission and absorption of waves on the boundaries of the band, a member is added to the equation, which is proportional to the derivative of the unknown function in time, and the constants determining the damping of the harmonic are found.

TITLE: Magnetohydrodynamic waves in a medium of diminishing density

CITED SOURCE: Dokl. VI Nauchn. konferentsii Novokuznetskogo ped. in-ta po fiz.-matem. naukam. Novokuznetsk, 1963, 111-114

TOPIC TAGS: magnetohydrodynamic wave, diminishing density, plane-polarized wave, non-compressible, infinitely conductive ideal fluid, homogeneous constant field, linear in z, non-compressible fluid

TRANSLATION: The author considers plane and plane-polarized waves in a non-compressible, infinitely conductive ideal fluid in a uniformly constant magnetic field, when the density diminishes monotonically in the direction of the field (x axis), and solves the problem by the method of separation of variables. In cases where  $\rho$  is linear in z or inversely proportional to z, the problem is completely solved, yielding the result that the intensity of the magnetic field

in the wave is proportional to  $1/z$ . Bibliography of 4 articles titles. A. A. Barmin.

TITLE: Binding materials used to reinforce surfaces of access roads in logging areasSOURCE: Lesnaya promyshlennost', no. 10, 1965, 22-24

TOPIC TAGS: access road, soil property, soil consolidation, soil type

ABSTRACT: The article discusses studies conducted since 1960 by the Belorussian Transportation Institute in. S. M. Kizov on the use of various types of roadbuilding and binding materials, e. g., gravel, cement, lime, etc., to reinforce the surfaces of dirt roads used primarily for the transportation of lumber in Belorussia. Studies of the physico-mechanical properties of soils treated by liquid bitumen, cement, lime, and peat show that a mixture of sandy soil and peat produces the highest degree of durability at a ratio of 30% peat to the weight of soil in dry weather conditions. This durability is increased by the addition of 15-20% of lime or 10-15% of cement, depending on the granulometric composition of the soil; when the soil is saturated by moisture, however, the durability considerably decreases. The greatest durability was obtained from the sand-gravel mixtures with a ratio of 40% of gravel to 50% of sandy soil. The

TITLE: High temperature inversion of the Hall coefficient in tellurium

SOURCE: AN SSSR. Doklady, v. 170, no. 4, 1966, 822-824

TOPIC TAGS: tellurium, Hall coefficient, temperature dependence, energy band structure, impurity conductivity

ABSTRACT: To obtain more information on the band structure and on the mechanism of impurity conductivity of tellurium, the authors measured the electric conductivity and the Hall coefficient of tellurium doped with thallium. In view of the low solubility of thallium in tellurium, the impurity concentration was determined by a radioactive tracer method. The apparatus and technique used to grow the tellurium single crystals were described elsewhere (Pribory i tekhn. eksperimenta no. 5, 172, 1961). The measurements were made by a standard method in the temperature interval 77 - 530K, both in the direction of the principal axis of the crystal and perpendicular to it. The results show that the Hall coefficient is independent of the direction of the crystallographic axes, but the electric conductivity is. In spite of the similarity between selenium and tellurium in structure, thallium has a different effect on the electric properties of tellurium than of selenium. The admixture of thallium greatly

Card 1/2

UDC: 539.293: 537

ACC NR: AR6033269

increases the electric conductivity of the tellurium, which remains of the p-type regardless of the thallium content. With increasing thallium content, the low temperature inversion point of the Hall coefficient shifts toward higher temperatures. The high temperature inversion point is shifted toward lower temperatures with increasing thallium concentration. A table of inversion temperatures as functions of the concentration is included. Although the number of holes per thallium atom is on the average 0.5, this still does not mean that the thallium atoms are direct acceptors in the tellurium lattice. The change in the second inversion point of the Hall coefficient of tellurium can be attributed either to the deformation of the energy band during the alloying of tellurium by thallium, or to the change of the density of states in the energy band. This report was presented by Academician N. P. Sazhin.

TITLE: Effect of preliminary cyclic loads of ultrasonic frequency on the creep rate of copper and D16T alloy

SOURCE: AN BSSR. Vestsi. Seryya fizika-tehnichnykh navuk, no. 2, 1965, 124-126

TOPIC TAGS: cyclic load, creep, oscillation, ultrasonic frequency, hardening, aluminum alloy, copper

ABSTRACT: This study was carried out with M1 copper and D16T aluminum alloy. The experimental data show that 1) preliminary application of cyclic loads of ultrasonic frequency drastically reduces the creep rate of the copper and aluminum alloy due to hardening, 2) the creep of copper samples loaded at static stress of +16.2 kg/mm<sup>2</sup> decreases 35.3% and at +21.5 kg/mm<sup>2</sup> about 61% as compared with that of nonloaded samples, 3) the creep of aluminum alloy decreases in the mean 30.6% as compared with the nonloaded samples, and 4) the degree of hardening depends mostly on the cyclic stress of the expansion and compression and to a lesser extent on the number of applied cycles. Orig. art. has: 2 figures and 4 formulas.

TITLE: Esters of Carboxylic Acids of 2-Hydroxyethyl-Amines and its Derivatives. III. Synthesis of Hydrochloride of Triethanolamine Tri-o-Chlorobenzoate

PERIODICAL: Societas Scientiarum Lodziensis Acta Chimica, 1959, Vol 4,  
pp 85 - 87

TEXT: While investigating the action of acid chlorides on triethanolamine, a new compound, the hydrochloride of triethanolamine of tri-o-chlorobenzoate was obtained. It was not described yet in chemical scientific literature. It crystallizes in the form of colourless plates with 97-98°C melting temperature. It dissolves easily in acetone, methanol and ethanol, sparingly in benzene and in water and is not soluble in ether. Quantitative analysis and molecular weight are in agreement with theoretical figures.

TITLE: Method of determining the thermostability of films obtained from polyvinyl alcohol solutions

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 3, 1963, 644, abstract  
3T412 (Polimery, tworzywa wielkocząsteczkowe, v. 7, no. 1,  
1962, 20 - 21 [Pol.])

TEXT: Polyvinyl alcohol (PA) turns yellow when heated for a certain time in hot air. The color change of the polymer depends on the quality of the PA used, the presence of admixtures, the temperature of treatment, etc. The study of the effect of different substances on the yellowing time of the polymer sample became an important problem with the aim of finding out those conditions at which the fibers, subjected to heat treatment at the technologically necessary temperature and duration, will not color. To achieve this, a rapid and suitable method was worked out, based on the determination of the thermostability of films obtained from PA solutions. The method consists in submerging a special test-tube end downwards into the PA solution being tested, and in the subsequent deposition of the

Method of determining the thermostability ... S/081/63/000/003/036/036  
B144/B186

polymer film in a coagulation bath consisting, for example, of concentrated aqueous solution of sodium sulfate. The film obtained is dried, together with the test tube, and then the thermostability of the film is determined. The thermostability is measured in a glass thermostat filled with silicon oil and filled with jacketed agitator, a contact thermometer, a control thermometer, as well as an electric heating unit. The thermostat is represented diagrammatically and the results obtained with the PA Gosenol no. 0-57 polyvinyl alcohol are given in a table. Using this method, the thermostability of other polymers can also be determined. The results have shown that the presence of sodium acetate in the polymer is responsible for the rapid yellowing of the fibers during the heat treatment. With an increasing content of sodium acetate in the polymer the thermostability of the films and the fiber produced from polyvinyl alcohol decreases correspondingly. pp 1393-1395

Abstract: [Authors' English summary modified] Authors re-  
port the details of their study on the therapeutic effect of  
ambutonium bromide in peptic ulcers, and conclude that 4 x 10  
mg daily for two weeks together with alusal is effective.  
Considering the time of absorption from intestinal tract, it  
should be taken one hour before meals in the case of gastric,  
and immediately before the meals in the case of duodenal ul-  
cers. There are five (5) English-language references.

The state of the circulatory system of physicians in one of the Silesian towns MED. PRACY 1956, 7/1 (57-63) Tables 2.  
A study on 152 physicians was carried out. The age ranged from 24 to 64 yr. The time of professional work ranged from 2 to 30 yr. Among the individuals, 16% presented chronic myocarditis, 5% hypertension of the first degree, 3.3% hypertension of the second degree, 1.4% hypertension of the third degree, 2% coronary artery disease, 3.3% neurovegetative dystonia. The most frequently encountered diseases among physicians were degeneration of the myocardium and hypertension. Coronary artery disease was not encountered frequently. Surgeons were affected more frequently by diseases of the circulatory system than their colleagues in other branches of medicine.

AUTHOR:

Róśdalski, Wacław, Docent, Doctor of Engineering

TITLE:

The Most Important Scientific and Didactic Achievements  
of the Mining and Metallurgical Academy and Directions of  
Investigations in Iron Metallurgy

PERIODICAL: Hutnik 1960, Nr 3, p 92 - 95

ABSTRACT:

In the introductory part of this article the author deals  
with the early history of the Academy which was formed  
in 1919 and originally composed of two departments and  
five chairs. Its most active organizers were the follow-  
ing professors: Engineer Różalski- and Bielawics,  
Engineer Korwin-Krukowski, Doctor of Engineering I. Pe-  
sczenko-Oropiński, Doctor of Engineering W. Jorkiewicz,  
Doctor of Engineering R. Dąbrowski, Engineer A. Lukićewicz  
and Engineer J. Buzek. During WW II the Germans closed  
the Academy. It was reopened in 1945 with chairs and in-  
stitutes covering new fields and subjects of metallurgy

The Most Important Scientific and Didactic Achievements of the  
Mining and Metallurgical Academy and Directions of Investigations in Iron Metallurgy

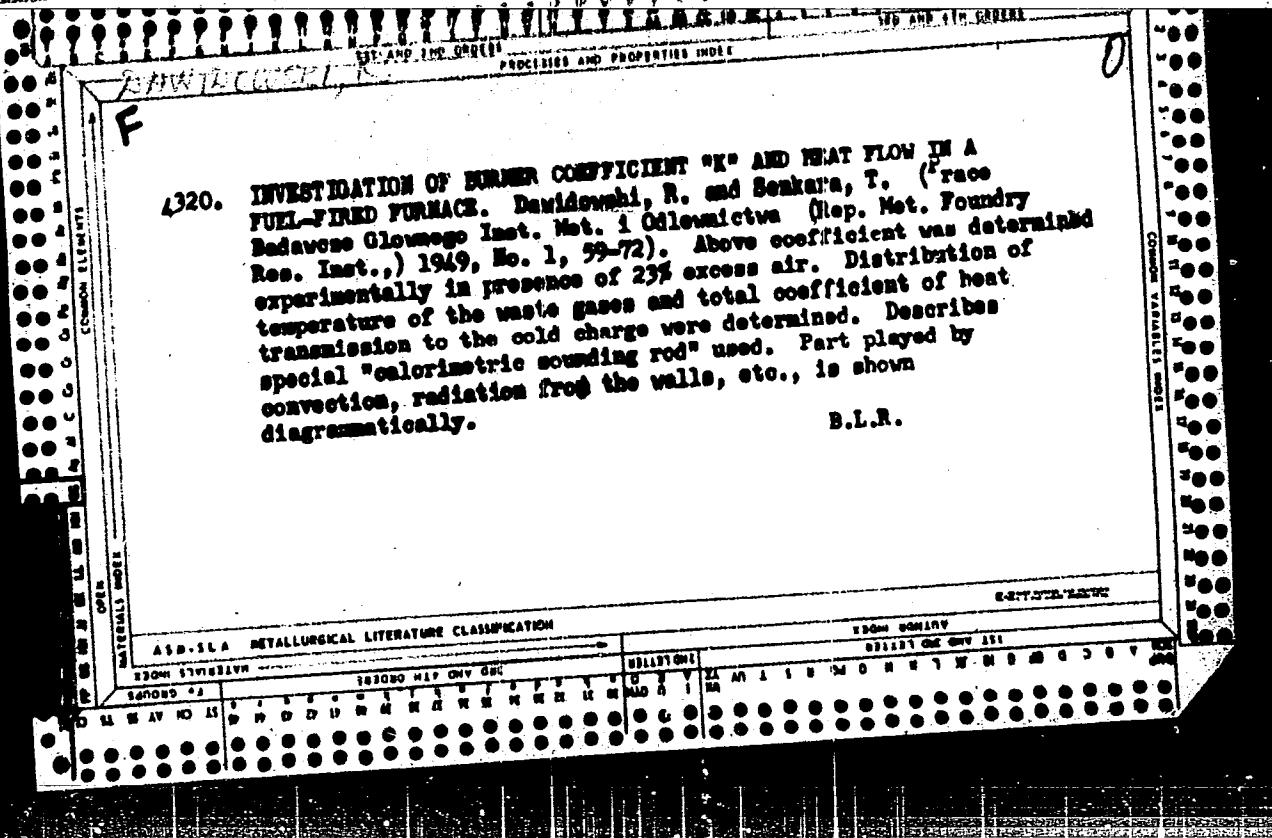

Professor Doctor of Engineering W. Łołkiewicz was the first in Poland to lecture on Light Metals Science and Metallurgy. The Chair of Heat Economy was inaugurated in 1925 and since Professor R. Dawidowski's death it is headed by assistant Professor Doctor of Engineering R. Andruszkiewski. The most important subjects being dealt with by the Chair are combustion of fuels and intensification of firing processes, in the industry theory of gas flow in metallurgical furnaces, combustion of solid fuels on grates, theory of metal recuperators and regenerators. Professor Andruszkiewski carried out some investigations on high- and low pressure gas burners and Doctor of Engineering K. Mirkus on dust extraction from flue-gases and me-

TITLE: Application of SU(3) symmetry to multiple meson production /7, 26

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniya, v. 3, no. 6, 1966, 237-240

TOPIC TAGS: nuclear collision, strong nuclear interaction, particle production, meson interaction, Pi meson, group theory

ABSTRACT: In view of the fact that the relation derived by K. N. Watson (Phys. Rev. v. 85, 852, 1952) for multiple production of mesons in a collision between a nucleon and a nucleus containing an equal number of neutrons and protons, viz.,  $\bar{N}^0/(\bar{N}^+ + \bar{N}^-) = \frac{1}{2}$  ( $\bar{N}^0$ ,  $\bar{N}^+$ , and  $\bar{N}^-$  are the average numbers of the  $\pi^0$ ,  $\pi^+$ , and  $\pi^-$  mesons), does not agree with experiment (this ratio is close to unity at  $10^{10}$ - $10^{12}$  ev energy), the author suggests that the quantity measured in experiment is actually  $(\bar{N}^0 + \bar{N}^{\eta})/(\bar{N}^+ + \bar{N}^-)$ , where  $\bar{N}^{\eta}$  is the average number of  $\eta$  mesons. In support, he calculates the latter ratio with the aid of SU(3) symmetry, evaluating the projection operators for the entire octet of pseudoscalar mesons. The analysis demonstrates clearly that the situation arising when Watson's theorem is generalized to the SU(3) case differs fundamentally from the situation prevailing during the multiple-production experiment, and

Card 1/2

L 21570-66

ACC NR: AP6008746

that for physically realized states of the produced mesons it is possible to estimate the ratio of the charged and neutral components. The entire analysis is based on the assumption that the SU(3) symmetry is exact. It is noted in conclusion that an estimate of the phase volumes shows that in the ultrarelativistic region the phase volume is practically independent of the masses, and that this takes place already for multiple production processes observed with the aid of an accelerator. Title : Effect of Herbicides on Bulrushes and Rice.

Orig Pub : V sb.: Kratkiye itogi nauchno-issled. raboty (Kubansk. ris. optyn. st.) za 1956 g. Krasnodar, "Sov. Kuban'", 1957, 82-86

Abstract : Herbicides (especially butyl ether - 2,4-D, and also chloro IFK) are an effective means of controlling the bulrush (*Ectlochloa maritimus*). The higher the dosage of the herbicides, the higher their destructive effect: with 2,4-D doses of 1, 1.5 and 2 kilograms/ha, 84.5, 89.4 and 92.6% of the weeds respectively, were destroyed and injured. However, the large doses of herbicides, particularly of 2,4-D, produce a negative effect on the rice crop. In small doses, herbicides act as growth accelerators. -- O.P. Medvedeva

TITLE: Construction of a Continuous Furnace with the Use of a Descending Shaft (Stroitel'stvo metodicheskoy pechi s primeneniem opusknogo kolodtsa)

PERIODICAL: Metallurg, 1957, No.12, p. 32 (USSR).

ABSTRACT: The method adopted at the Nizhne-Tagil'sk Metallurgical Combine for constructing a new reheating furnace without disturbing the foundations of the existing one or of the supporting columns is outlined. A truncated open and bottomless box 23184 x 9316 mm external dimensions (Fig.2) of type 140 heat-resisting reinforced concrete with sharp wall bottoms was placed in the partly-dug foundations and loaded. The walls were built up by concreting and when this had set the structure was loaded with blooms. Soil was removed from under the walls and inside the box and the box descended. For effecting required alterations in roller tables new tables were mounted on a special bridge. Design of the equipment was carried out by the Stal' proyekt organisation and the local team of the Gipromez organisation. Construction was by the Tagil'stray trust and the combine. There are 3 figures.

TITLE: Passage of Light Through Optical Waveguides

PERIODICAL: Optika i spektroskopiya, 1960, Vol.8, No.5, pp.713-720

TEXT: The authors discuss passage of light through cylindrical optical waveguides with specularly reflecting walls, using the geometrical-optics approximation. The discussion deals with the following cases: 1) waveguides with a light source of uniform intensity lying on the waveguide axis and with a source whose intensity is proportional to the cosine of the angle made with the waveguide axis; 2) waveguides with and without total reflection at its internal surfaces and also waveguides with the walls coated with a special reflecting layer; 3) waveguides for which absorption of light in the walls is neglected and waveguides for which this absorption is allowed for. The transmission coefficient is obtained for these cases and the dependence of this coefficient on the waveguide dimensions and conditions of reflection at the walls is discussed. The authors also compare waveguides of various types. The paper is entirely theoretical. There are 3 figures, *VB*.

TITLE: Passage of light through diffuse light pipes 5

SOURCE: Optika i spektroskopiya, v. 17, no. 5, 1964, 775-783

TOPIC TAGS: light pipe, light transmission, light reflection,  
diffusive motion

ABSTRACT: This is a companion paper to earlier work by the authors (Opt. i spektro., v. 8, 712, 1960) dealing with the passage of light through light pipes with specularly reflecting walls. Since light pipes with diffusely reflecting walls are frequently used to pipe light from scintillators to photomultipliers, the authors calculate the light transmission of a diffuse pipe light, by determining the forward motion of the photons reflected from the pipe walls with the aid of the diffusion equation. The calculation results were

Card 1/4

L 16130-65

ACCESSION NR: AP4048753

then tested, using the set-up shown in Fig. 1 of the Enclosure, for light pipes made of drawing paper (reflectivity  $R = 0.82$ ), porcelain ( $R = 0.75$ ), and porcelain tubing coated with white highly reflecting paint ( $R = 0.94$ ). The results demonstrated the applicability of the diffusion theory for the description of the passage of light through diffuse light pipes. Discrepancies between theory and experiment at longer wavelengths are explained. Comparison with specularly reflecting light pipes indicates that for short relative lengths the diffuse light pipes can compete with the specularly reflecting ones and furthermore provide a more uniform light flux over the surface of the multiplier cathode. They cannot compete, however, with pipes of the mixed type, which combine total internal reflection with diffuse reflection. Orig. art. has: 5 figures and 18 formulas.

TITLE: Angular distribution of light from a NaI(Tl) scintillator

SOURCE: Zhurnal prikladnoy spektroskopii, v. 2, no. 1, 1965, 80-82

TOPIC TAGS: sodium iodide scintillator, scintillator emission, scintillator intensity distribution, angular dependence

ABSTRACT: The angular dependence of the intensity of light from a packed NaI(Tl) crystal was investigated experimentally with an installation in which the scintillator was excited with collimated gamma-radiation from  $\text{Co}^{60}$ , and the luminescence light was made to strike a photographic film. A diagram of the installation is shown in Fig. 1 of the Enclosure. The film was developed under controlled conditions and the crystal emission curves were determined by microphotometry of the film. The results are shown in Fig. 2 of the Enclosure and indicate that anisotropy of the light intensity is observed whether or not an optical constant is present. It is pointed out in conclusion that the results can be used to obtain more precise data on the light transmission from the NaI(Tl) detector over a light pipe. Orig. art. has: 2 figures and 1 formula.

 TITLE: Determining the effective coefficient of light absorption in long plastic scintillators  
 SOURCE: Zhurnal prikladnoy spektroskopii, v. 2, no. 4, 1965, 371-373  
 21, 44, 55  
 TOPIC TAGS: scintillator, light absorption, gamma luminescence, luminescent material  
 ABSTRACT: It is shown that the attenuation in the scintillator material of light emitted by that scintillator may be determined only by measuring the luminescence spectrum, spectral sensitivity of the photocathode which detects the radiation, and spectral coefficient of absorption of the scintillator material throughout the entire range of wavelengths emitted by the scintillator. An experimental method is described for direct determination of the "effective" coefficient of absorption. The transmittance of  $\alpha$ -stimulated light is measured in long cylinders of scintillation plastic. In a second set of experiments, the transmittance of light stimulated by a collimated beam of  $\gamma$ -rays is measured. The results are given in graphic form. A formula is derived for the transmission factor as a function of length. Orig. art. has: 3 figures, 5 formulas.

TITLE: Wire Strain Gages (Provolochnyye tensometry)

PERIODICAL: V sb.: Izmereniye napryazhenii i utility v detalyakh mashin.

Moscow, Mashgiz, 1955, pp 5-4]

**ABSTRACT:** A description is given of the properties of "wire-type strain-gage" pickup; experimentally plotted curves are given for hard and annealed aluminum and Nichrome wire, curves showing the dependence of the areas and of the relative change in the electrical resistance on the relative elongation  $\epsilon$  (for elongations  $\epsilon$  up to 0.8%). The authors examine the actual process of transmission of the strain signal forces from a metal specimen or machine part to a strain-gage pickup glued to it, making due allowance for the stiffness of the glue used. The matter of selecting the stiffness of the strain-gage pickup is discussed. The manner of selecting the stiffness of the gage or wire, current, and electrical resistance must be compatible with the type of electrical meter being used is analyzed, and formulas with graphs are given to facilitate that selection. Analyses also are various methods of moisture-proofing the strain-gage pickups, and

Card 1/3

#### Wire Strain Gages

experimentally plotted curves are given showing the relationship between the amount of creep exhibited by the glue that is used and the temperature of the strain-gage pickup wire. Included, too, are: a) data on the mechanical hysteresis exhibited by different strain-gage pickups pasted on with different types of glue; b) formulas permitting calculation of the maximum allowable length of a pickup intended for recording strain induced by high-frequency dynamic loads; c) a brief listing of the properties of the metals employed to make the strain-sensitive wires used as pickups; and d) number of glue recipes. A description is given of the techniques and equipment used in the manufacture of strain-gage pickups; described also is a design for pickups capable of functioning at temperatures of up to 600°C. Described, in addition, three types of electronic equipment suitable for use with wire pickups, the authors give: 1) a full circuit diagram for ad several data on all the elements of the LSD static-strain detection developed by the Institut mashinovedeniya AN SSSR (Institute of Machine Construction, Academy of Sciences, USSR) [ISD a Izmeritel'nyy staticheskikh deformatsii radio-tubusov i strain-gage]; 2) a schematic diagram of the instrument; 3) a note on the use of OVN television tubes and having a 50-cps measuring bridge. (Reviewer's Note: In the circuit diagram given for this instrument an error

Wire Strain Gages

appears: the indicated anode connection points of the 6KH2P radio tube should be reversed); 2) a full circuit diagram of an automatic strain recorder that makes strain recordings at 170 different points in the course of 80 seconds; included is a diagram of the instrument's 120-point switch; 3) a summary account of the full-beam deflection parameters on <math>\omega</math> 500 rad/sec current loads of the high-sensitivity transverse-type vibrators put out by the "Geofizika" plant (Geofizika - Geophysics; Transil, Novi), plus a detailed description of a UD-3 type strain-testing laboratory capable of recording dynamic strains of frequencies up to 1,500 cps. A brief description is given also of a cathode-ray oscillograph specially designed to record impact strains.
